* Mandatory

A.1. Current position

Job Title	Titulado superior de actividades técnicas y profesionales		
Starting date	2018		
Institution	Consejo Superior de Investigaciones Científicas		
Department / Centre	Departamento de Biodiversidad y Biología Evolutiva / Museo Nacional de Ciencias Naturales		
Country	Spain	Phone Number	(0034) 914111328 - 988968
Keywords	Computational biology; Population genetics; Population biology; Biogeography; Nature conservation; Animal ecology; Fresh water ecosystems		

A.2. Previous positions

Period	Job Title / Name of Employer / Country
2017 - 2018	Investigador convenio / Universidad de Navarra / Spain
2012 - 2012	Licenciado / PROED Evaluación, diagnóstico y apoyo a las necesidades educacionales / Spain

A.3. Education

Degree/Master/PhD	University / Country	Year
Máster en Bioinformática Aplicada a la Medicina Personalizada y la Salud	Instituto de Salud Carlos III / Spain	2023
Programa Oficial de Doctorado en Biología y Medio Ambiente	Universidad de Navarra / Spain	2017
Máster Universitario en Ecología	Universidad Autónoma de Madrid y Universidad Complutense de Madrid / Spain	2011
Licenciado en Biología	Universidad de Navarra / Spain	2009

A.4. General quality indicators of scientific production

I have been involved in 6 projects of population genetics, biogeography and demography in natural populations. Based on this research, I have taken part on 25 peer-reviewed research papers, from which I am the first or the corresponding author in 10. 20 of these papers are published in JCR journals, 8 of them in the first quartile (Q1) in Ecology and Zoology. These publications have received 241 citations in the last 5 years (Google Scholar). I have been invited to review papers for Journal of Evolutionary Biology, Ecology and Evolution, Amphibia-Reptilia,

Basic and Applied Herpetology, PeerJ, The Herpetological Journal, Biological Journal of the Linnean Society, Molecular Ecology, Heredity, Hydrobiologia and Journal of Natural History. I have presented my work in 5 Iberian and 3 international scientific conferences on Evolution and Herpetology, where the growing empirical body from our long-term amphibian monitoring program is raising interest as it provides new demographic, biogeographic and evolutionary inferences about Iberian biodiversity. I have also presented 7 talks in scientific workshops and imparted 6 seminars in different research centres. At the same time, I find scientific dissemination very rewarding, so I have participated on the European Researchers' Night and the World Environment Day, talked to the general public in faires and mass media interviews and to school kids about evolution and historical scientific breakthroughs, and written one dissemination paper. I also maintain a public profile in ResearchGate, where my publications have been consulted 6916 times.

In 2010 I participated on the setting up of the amphibian monitoring program in Laguna de Valdemanco (Central Spain) led by Dr. Íñigo Martínez-Solano, who co-supervised my PhD. Since that year, we have been continuously documenting the largely unknown demography of nine amphibian species by individual capture-mark-recapture methods with passive integrated transponder tags. So far, we have marked more than 8300 individuals of the nine species and obtained increasing recapture rates through the years (>25% in most species), which is leading to accurate demographic estimates and unprecedented dispersal records, as already demonstrated in our latest papers. I have co-supervised 15 graduate and postgraduate student projects with Dr. Martínez-Solano, with excellent results in all cases. I have combined annual fieldwork effort with stays at national and international research centres, where I improved my skills for the optimization of species-specific molecular markers, pedigree reconstruction, population genetic analyses and age estimation by skeletochronology, building up and consolidating the multidisciplinary scientific profile that is required for integrative demographic research. My international stay at the Zoological Society of London led to fruitful collaborations with theoretical geneticist Jinliang Wang, who co-authored three of my papers and has since then become involved in our amphibian monitoring project. I have also collaborated with Drs. Iván Gómez-Mestre and Carmen Díaz-Paniagua from the Eco-Evo-Devo group at the Doñana Biological Station, who accumulate decades of amphibian demographic data. At this stage I seek to integrate new molecular techniques (genomics), theoretical frameworks and computational pipelines to address demographic questions with higher resolution power.

Part B. CV SUMMARY

My research focuses on evolutionary biology, mainly on processes occurring at small spatial and temporal scales, at which intraspecific demographic dynamics operate. Demographic research is largely neglected in scientific funding programs but is essential to understand the mechanisms of species persistence, differentiation and extinction. From this perspective, I advocate for a more prominent role of demographic research in evolutionary and conservation biology by integrating 1) molecular tools, 2) population monitoring based on capture-mark-recapture (CMR) techniques and 3) optimized computational procedures based on solid theoretical background, with the goal of providing robust, reliable, comparable and applicable protocols for the study of natural populations. These three foundations compose the backbone of my research line. Regarding the first (molecular tools), I have optimized species-specific molecular markers (microsatellites) for three Iberian amphibians: *Epidalea calamita*, *Hyla molleri* and *Pelophylax perezi*. I explored their usefulness for genetic diversity characterization and provided comprehensive guidelines for their application in ecological studies. The markers proved effective for species identification, pedigree reconstruction, effective population size estimation, genetic structure and gene flow assessment, and historical demographic inference (see my papers in *Journal of Heredity*, *Herpetological Journal*, *Ecology and Evolution*, *Journal of Biogeography*, *Integrative Zoology*, *Oikos*, and *Biology Letters*). I also collaborate in the optimization of microsatellite markers for the critically endangered Lear's Macaw and their application in conservation programs (see my paper in *Molecular Biology Reports*). My next priority is the inclusion of genome-wide markers to address demographic questions with significantly increased resolution power. With respect to the CMR framework, our ongoing 11-year amphibian monitoring program in Sierra de Guadarrama (Central Spain) is yielding

an extensive and high-quality dataset based on the number of marked animals and the recapture rates obtained through time (see the 'General quality indicators of research' section). I have successfully applied POPAN and robust-design procedures for the estimation of census population size and survival in different species, which in turn led us to optimize sampling design and field procedures to maximize the efficiency of recorded data while minimizing animal manipulation. Building upon this background, I seek to establish new collaborations to train myself in state-of-the-art multistate and recruitment models. Regarding the last of the three foundations (computational procedures), my stay at the Zoological Society of London with Dr. Jinliang Wang provided me with the basics of informatic script programming for analytical automatization in R, performing customized pipelines for specialized software like Colony or Structure. After finishing my PhD, I widened my expertise with new programming languages (JSON, Python) and environments (Linux) and applied them for environmental research during my participation in the Life+ Respira project. Building upon my training in the different aspects of integrative demography, in the next years I prioritize formation in next-generation sequencing techniques and theoretical background in Population Genetics to expand this line of research and widen scientific resources for the quantitative study of animal populations.

Part C. RELEVANT ACCOMPLISHMENTS
